ABSTRACT
This research determines the perceptions of students and lecturers on using e-learning at a private university in Batam. A mixed methods approach was employed to find out these perceptions. Researchers further collected the data through open and closed questionnaires from 243 students (2019-2022 school year) and 19 lecturers who were actively teaching and using e-learning. After obtaining the data, the questionnaire results were calculated using SPSS software version 25 and transcribed qualitatively. The results show that students and lecturers had positive perceptions towards e-learning. This is measured by the knowledge, adaptation, benefits, and attitudes of students and lecturers in using e-learning. However, several obstacles were faced by them, such as time management, difficulties in accessing the e-learning website, the user interface (UI) display is quite complicated, unsupported internet signal, and others. It can be concluded that both lecturers and students have good ability in using e-learning at higher education levels.

Keywords: e-learning; higher education; perceptions

INTRODUCTION
One form of educational innovation is the application of an online learning system or often referred to as e-learning. The concept of e-learning becomes a transformation in this modern educational era. According to Sabar (2011), e-learning is defined as a type of teaching and learning systems that allows the users to gain information in educational field. Anggraini (2018) adds that e-learning can be done remotely without face-to-face meeting in the room, making learning time more flexible. In other words, people who access this learning system gain information easily and quickly.

The use of e-learning has been carried out by several researchers (Goyal, 2012; Mardiah, 2020; Muzamilah et al., 2020; Rawashdeh et al., 2021; Rosalina et al., 2020). Most of the research found that there are advantages that can be gained not only for the students but also the teachers. They state that e-learning can improve students’ achievement in learning because they easily can access the materials. However, e-learning was still difficult to use especially for stakeholders in university level. The obstacles they face include network constraints, insufficient smartphone storage to store files, and the limited quota they have for participating in online learning (Ja’ashan, 2020; Marsevani, 2022).

Before conducting the research, researchers interviewed lecturers and students at a private University in Batam, researchers found that there were several obstacles in accessing e-learning such as lack of information and guideline in using e-learning for students in the first year. Other students said that the server was always down when it was accessed by many students. The lecturers also claimed that there were many features that made them confused to use. In other words, the display of e-learning is quite complicated so that the lecturer has difficulty presenting teaching material. Hence, researchers planned to investigate the perceptions of students and lecturers on using e-learning and gain deeper about problems of students and lecturers while using e-learning in higher education.
METHODS
This research used a mix methods approach. It is used to explain the obstacles faced by students and lecturers in using e-learning. The researchers conducted research at one of private university in Batam, Kepulauan Riau, Indonesia. It was selected because after interviewing the head of department English language education, she claimed that she started implementing e-learning in early 2020 until now. The researchers chose this private university as a research location because it is one of the private universities that facilitate students and lecturers using e-learning to make it easier to meet the learning information needs on campus. The implementation of this research took place from November to December 2022.

The researchers decided to choose active students of 2019 to 2022 and lecturers in all majors of the undergraduate program in higher education as participants of the research. Furthermore, the researchers chose the participants randomly. The total participants of the research were 243 students and 19 lecturers. The data consisted of 161 female students, 82 male students. And 8 female lecturers, 11 male lecturers.

In this research, the researchers used open and close ended questionnaires. The questionnaire was adapted from Ja’ashan (2020) and Basar et al. (2021) The questionnaire was made through Google Form and distributed through WhatsApp application. Because it can be distributed to a large number of respondents in a relatively short time. All data collected through a questionnaire survey were classified and grouped according to indicators of students’ and lecturers’ perceptions of using e-learning. The close ended questions further were converted into average values and categorized based on the interpretation of the Likert four-point range score. After that, the data was analyzed using SPSS Version 25 software. For open-ended questions, it was used to gain students and lecturers’ perceptions of e-learning. The participants were invited to expand on a respond to the questions given by researchers. Researchers recorded the individual responses then transcribed word by word.

RESULTS AND DISCUSSION
Students’ perceptions of e-learning
The result that was obtained from the questionnaire shows 89.7% of students had used e-learning. It was also found that 86.8% of the students had accessed e-learning in university level. In other words, most of them used e-learning in university level and they have background knowledge of using e-learning as an online learning activity. The background knowledge of using e-learning is important because it brings the feeling of self-responsibility in learning activities (Arkorful & Abaidoo, 2015; Chitra & Raj, 2018; Mardiah, 2020).

Most respondents further recognized and were familiar with e-learning in which they could described about e-learning platform. They said e-learning is an electronic learning application that has up-to-date features for online learning anywhere and anytime, and a platform that functions to assist lecturers and students in learning such as distributing material and collecting assignments. This statement is similar with Chitra and Raj (2018) who points out e-learning is electronic forms applied in educational field that commonly used to access learning materials.

Students’ perceptions of adapting the use of e-learning

</tbody>
</table>
Students’ and lecturers’ perceptions towards e-learning in higher education

Table 1 presents the findings obtained from the results of the students’ perceptions on adapting e-learning. It turns out that item number 2 concerning the language used in e-learning has the highest average of 3.34. Meanwhile, item number 3 has the lowest average of 3.18. These findings indicate that most students easily understand the language used in e-learning.

<td>Agree</td>
</tr>
</tbody>
</table>

There is also a display on the main e-learning page containing information about the whereabouts of the user, menus with display icons in English and Indonesian which are easy for students to understand. This finding is in line with Lugianti et al., (2022) which states the language criteria that are easily understood by users on e-learning is from in terms of icon function display, the language used (Indonesian or English) and information about course material.

Students’ perceptions of advantages e-learning

<td>0.69</td>
<td>Strongly Agree</td>
</tr>
</tbody>
</table>

The results show that most of the students agreed that using e-learning is very useful. They pointed out that it can increase their productivity in learning English because they are able to access the materials everytime. Fakhri et al., (2022) states that one of the advantages of using e-learning is the access of using e-learning. The benefits of e-learning during the learning process further can be seen from the results of research from Marsevani, (2022), Amri et al., (2021), Ferdiansyah et al., (2020) and Amalia and Pujiastuti (2017) that points out the use of this platform provides opportunities to the students such as gaining the information easily, accessing the materials in flexible time, and improving their learning performance.

Students’ difficulties of e-learning

Five obstacles are explicitly described including difficulty accessing the e-learning website, the display of e-learning is quite complicated, and it is difficult to upload assignment files because limited file size, difficult to access the e-learning website and unsupported internet signal. It means obstacles are often found when using e-learning (Anggun, 2021).

The first obstacle the respondent wrote was the inability to access the e-learning website which is sometimes difficult to access, especially during peak hours and the server is under repair. The use of a learning media does require adequate facilities and infrastructure, so that everything can go according to what has been planned, in line with the findings Al-Balas et al., (2020) one of the most common e-learning problems experienced by students in learning e-learning is a technical matter that is, accessing websites, devices, tools, and processes. Zalat et al., (2021) suggests the university that use e-learning to have IT center in order to to overcome this problem.
The constraints of the two respondents writing the appearance of e-learning is quite complicated so that students have difficulty using it. In line with Hatip et al., (2019) who researched the problems of the e-learning website which users still often complain about, one of which is the appearance of the user interface design which is less attractive because users are bored with the appearance of the website both in terms of color, menu arrangement, and descriptions and content language used. So, the researchers made improvements to the user interface design in e-learning.

The third obstacle was that the respondent wrote that it was difficult to upload the assignment file in e-learning due to the limitation of the maximum file size of 2 MB. In line with Febrianti et al., (2021) that there are many obstacles in using the features contained in e-learning, one of them is utilizing the assignment feature. There are those whose capacity to upload the task file is so small that if the file is uploaded the task must be reduced first. This obstacle had a major impact on the collection of assignments during the lecture process causing students to be late in sending assignments so that the assignment scores were forced to be empty (Lutfiyah, 2022). It can be seen that failed file uploads are very easy to overcome, students only need to upload files below the maximum number of uploaded files by reducing files using software or applications that function to compress PDF, Word, Excel files, or various image formats (Alviolita, 2015).

The fourth obstacle was that respondents wrote that it was difficult to submit assignments in E-learning on iPhone or iOS users. In this obstacle students can upload assignments on the E-learning website via a computer or laptop that is not using iOS. However, Alviolita, (2015) mention the inability to upload assignments using a cellphone is not a big problem.

The last obstacle the respondent wrote was having network or connection constraints. In E-learning-based learning, a good internet connection is needed so that learning becomes effective and efficient so that it can achieve the desired educational goals (Selfi & Akmal, 2021). However, in reality some students experience problems connecting to the internet network, this is due to the price of using internet data which is still considered quite expensive for some students. The way to overcome this can be done by providing quota subsidies. This has been implemented by the government in collaboration with a number of internet service providers. This aims to ease the burden on students and parents to meet internet quota needs. In fact, the quota provided has also been adjusted for online learning needs only so that it is not misused for other purposes (Gempiara & Supendi, 2021).

Lecturers’ perceptions of e-learning

In the indicator of the lecturer’s perceptions of e-learning knowledge, the researchers found out the lecturer's knowledge of e-learning. All of the lecturers had used e-learning. They have experience in using and designing learning materials, collecting of assignments and discussions through e-learning. In other words, e-learning is not new phenomenon for lecturers. They are familiar with e-learning and their experience surely affect the successful of e-learning (Ja’ashan, 2020). However, the lecturers claimed that not all the features had been used. It was because they felt confused how to use the features and did not have much time to design the materials in e-learning well. It makes them very hard to design interactive e-learning appearance. It means that most of the lecturers had difficulties in time management to design the e-learning (Bhuana & Apriliyanti, 2021; Rosalina et al., 2020).

</table>
Students' and lecturers' perceptions towards e-learning in higher education

In Table 3, it turns out that in item number 2 regarding the language used in e-learning has the highest average of 3.21. It can be stated that most of the lecturers easily understand the language used on e-learning. Although some of them still had difficulties in adapting e-learning, most of them felt the use of e-learning was easy to use and learn. Hence, it helps them to give materials and instructions for students. It means the effective of providing information and materials for the students is supported by e-learning (Hafeez et al., 2022).

**Lecturers' perceptions of the advantages of e-learning**

<table>

</tr>
</tbody>
</table>

The results showed that lecturers' perceptions of the perceived benefits of using e-learning turned out to be in item number 4 about being able to check assignment submissions from students whenever and wherever it had the highest average of 3.52 which was categorized as strongly agree. It can be stated that most of the lecturers can check the collection of assignments from students anytime and anywhere in e-learning. Fakhri et al., (2022) points out that lecturers have an access to check assignment submissions from students easily. It means that the use of e-learning has a pretty good effect as shown by lecturers who have the convenience of uploading teaching materials, delivering material, and assignments wherever and whenever. The opposite result occurred in research from Wijaya et al., (2020) explaining that e-learning has no effect on lecturer teaching results because of limited internet access, lecturer teaching hours are not limited, lack of communication and socialization between students and lecturers.

**Lecturers' difficulties of e-learning**

Based on the results, there are technical and non-technical issues faced by the lecturers. The first obstacle was it is sometimes difficult to access, especially during peak hours and the server is under repair. One of the most frequent e-learning problems that students experience in e-learning is technical problems, one of which is accessing websites, devices, tools, and processes (Al-Balas et al., 2020). To overcome this problem students can contact the person responsible for the online e-learning code or access the website outside of peak hours (Tavangarian et al., 2004; Vitoria et al., 2018; Zalat et al., 2021).
The second obstacle is that the display of e-learning is quite complicated so that lecturers have difficulty using it. In line with Hatip et al., (2019) who examines the problems of website e-learning. One of the things that users often complain about is the appearance of the user interface design which is less interesting because users are bored with the appearance of the website both in terms of color, menu arrangement, as well as descriptions and contents of the language used. So, the researchers made improvements to the user interface design in e-learning. Another difficulties found was they had not much time to prepare and design the learning materials well (Marsevani, 2022).

However, good adaptability is also needed from lecturers to be ready in using e-learning. One way to improve lecturers’ readiness in using e-learning is by providing the training or workshops (Setiaji & Dinata, 2020). This training will be able to ease lecturers to understand the use of e-learning and avoid confusion. In other words, lecturers will have good and clear management in implementing e-learning (Vovides et al., 2007).

**CONCLUSION**

It can be concluded that both students and lecturers have good perceptions towards the use of e-learning. This perception is measured from the knowledge, adaptation, benefits, and attitudes when they use e-learning. Although most of the categories are categorized as good, there are still several obstacles that hinder learning in using e-learning such as difficulties to access the e-learning website, the appearance of the e-learning is quite complicated, time management difficulties for lecturers, difficulties to upload files task due to limited file size, difficulties to access the e-learning website, and unsupported internet signal.

This research hopefully is useful not only for the readers but also stakeholders that use e-learning in their learning management. The obstacles found in this research also can be noted for the universities to make e-learning system more effective and efficient. Moreover, the researchers hope that training of using e-learning can be carried out regularly by IT Center in order to improve students’ and lecturers’ experience in using e-learning. By having more experience regarding the use of e-learning, lecturers will be able to design learning materials well with limited time. Furthermore, students also have more knowledge to roll out learning successfully.
